A Turnkey Approach for Your Accurate CMDB Data

What's the risk?

Traditional approaches of manually building and reconciling CI data for your CMDB platform are no longer viable—when one piece of misinformation can be detrimental to the organization and its operations.

99%

99% of enterprises using CMDB that don't confront CI data quality gaps will experience visible business disruptions.[1]

Economic impact

Operational downtime costs enterprises an average of **$300,000 per hour.[2]**

A CMDB is a fundamental tool for managing an enterprise's IT operations environment. The CMDB enables powerful workflows for handling a variety of business processes. And because they provide visibility into the interdependencies between the organization's people, processes, applications, and IT infrastructure, CMDBs are essential for making day-to-day decisions around those processes.

And all the CMDB's power relies on accurate IT asset data—those configuration items (CIs). But getting reconciled, accurate, and up-to-date CI data in a CMDB is a significant challenge. Sevco Security can help.

> "Sevco helps us have high value in our CMDB and high confidence in the data that's in it, so we can make valid decisions."

Get to trustworthy CI data

Sevco brings quality and efficiency to your CMDB's asset inventory by aggregating and deduplicating unique inventory reports from your multiple data sources to deliver a reliable source of truth of your enterprise-wide asset ecosystem.

You'll gain accurate CI data for your CMDB decision making. When your organization can trust the CMDB data, you can fully leverage the value the CMDB has to offer the organization.

Experience valuable business outcomes

Sevco integrates seamlessly with your CMDB technology, delivering quality and performance improvements for your IT and operational processes, including:

· Relieves your resources from manual IT asset management
· Provides a current view of your ever-changing environment
· Increases trust in your CMDB data for confident decision making
· Drives greater value from your CMDB investment

Sevco Security in Action: Empowering Your IT Ops with a Healthy CMDB

Sevco provides your IT Ops team with a modern, turnkey approach for your CMDB's asset management—one that alleviates the challenges by automatically analyzing inventory sources to deliver a complete and real-time view of the environment.

Seamless CMDB integration

Our API-driven solution provides off-the-shelf integrations with leading CMDB solutions like ServiceNow and natively integrates with a wide breadth of asset sources, including tools that reside across your cloud and on-premises infrastructure.

Real-time and automated

Sevco automates your IT asset inventory process and generates real-time telemetry that captures your changing asset ecosystem. This ensures you're working from a current and correct view of your environment.

## Multi-sourced asset reconciliation

Joins disparate inventory sources and digs into the details with our correlation engine to reconcile and deduplicate your CI records, removing the burden of manually building correlation rules, such as ServiceNow IRE rules, within your existing CMDB platform.

Increases CMDB value

Sevco applies a rigorous approach to asset management that gives you reliable CI data for your CMDB decision making. The result improves the value of your CMDB and boosts confidence in the business outcomes.

About Sevco Security

Sevco is the cloud-native CAASM platform delivering the industry's most accurate, real-time IT asset inventory. Hundreds of companies rely on Sevco's 4D Asset Intelligence engine to bridge the gap between IT and security teams. By providing a continuously updated inventory of assets, Sevco autonomously identifies and closes previously unknown security gaps, while dramatically improving incident response. Sevco's patented asset telemetry uncovers significant security gaps and out-of-compliance assets in every deployment without fail. Founded in 2020 and based in Austin, Texas.
